Roll : 02.

Prisma: Prisma is an ORM that lets us define database models in a schema file In project-I, it was used to create a Quote model and interact with a mongodb Atlas Database using Javascript.

MongoDB + Prisma: Prisma supports Mongodb using the @ db.Object Id type for the ID field. we used @ default (auto()) @ map (" id") to match mongodb's native document structures.

Express API: we builts a REST API using express with GET and POST routes. It lets us fetch all quotes and add new quotes in the frontend.

Middleware: Middleware in express runs between the request and response cycles. we used middleware like express.json() and body-parser to parse JSON data from POST requests.

Frontend JS fetch: we used Javascript fetch() to send and recieve quote data via the API, submitted quotes are immediately displayed by reflecting them ~~through~~ from the server.
